# Velocity and Magnetic Shear in AR 10486 Source of the Halloween Events

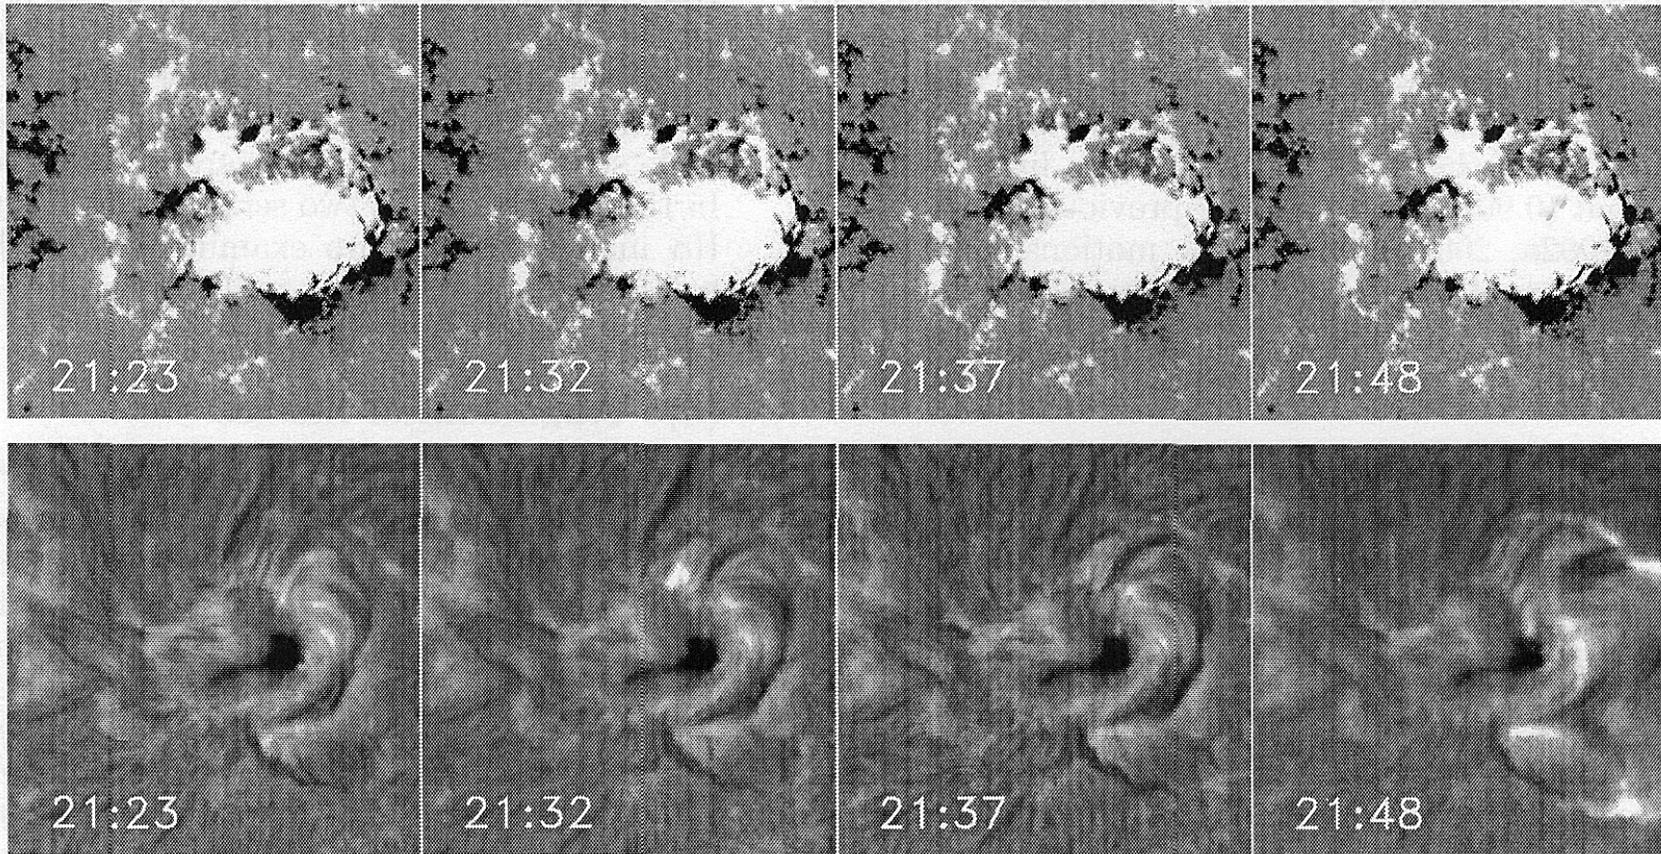

- Velocity Shear Yang et al. 2004, ApJ 617 L151, Magnetic Shear Liu et al. 2005 ApJ 622, 722

# Magnetic Shear Indicated by Ha Filaments

- AR 9236

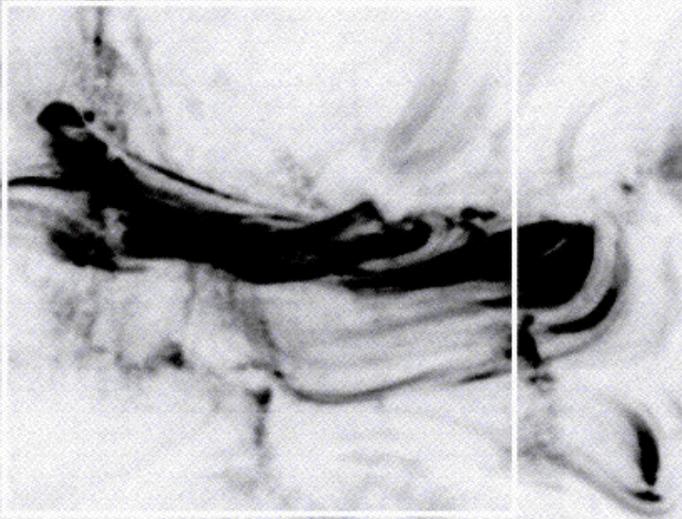

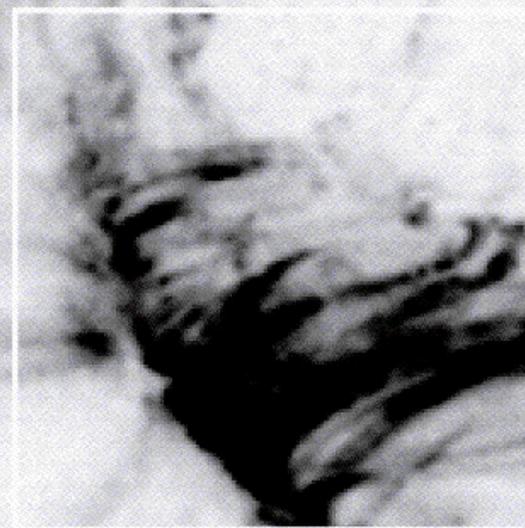

## Magnetic Shear in the Corona seen by TRACE

- AR 9026 before and after a CME
- Liu et al. 2005, ApJ 622, 722

**(e) 14:54 UT**

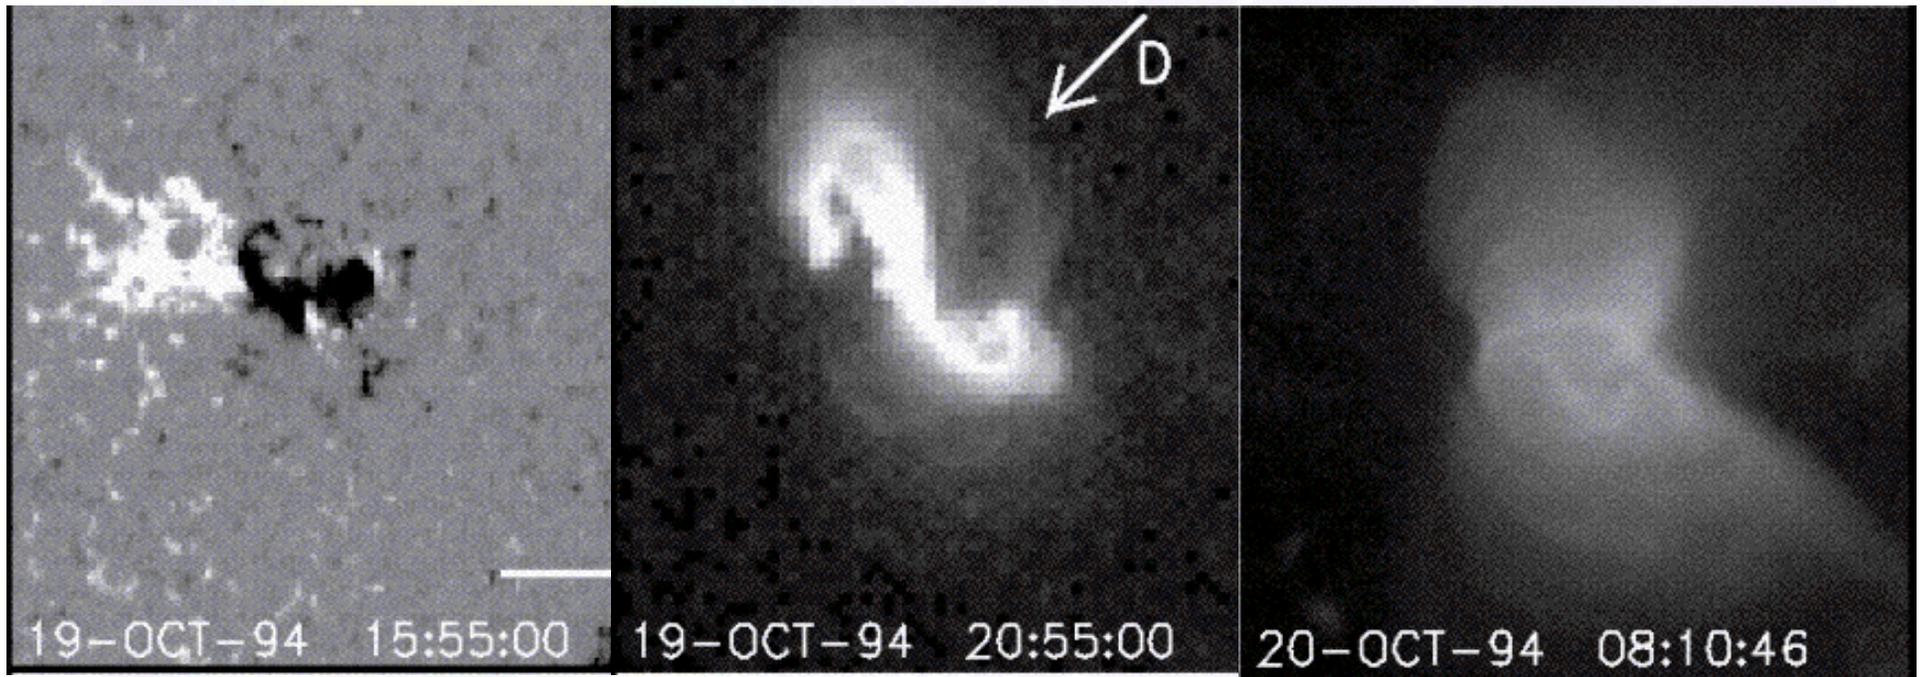

**(f) 17:05 UT**

## Magnetic Shear in the Corona: X-Ray Sigmoids

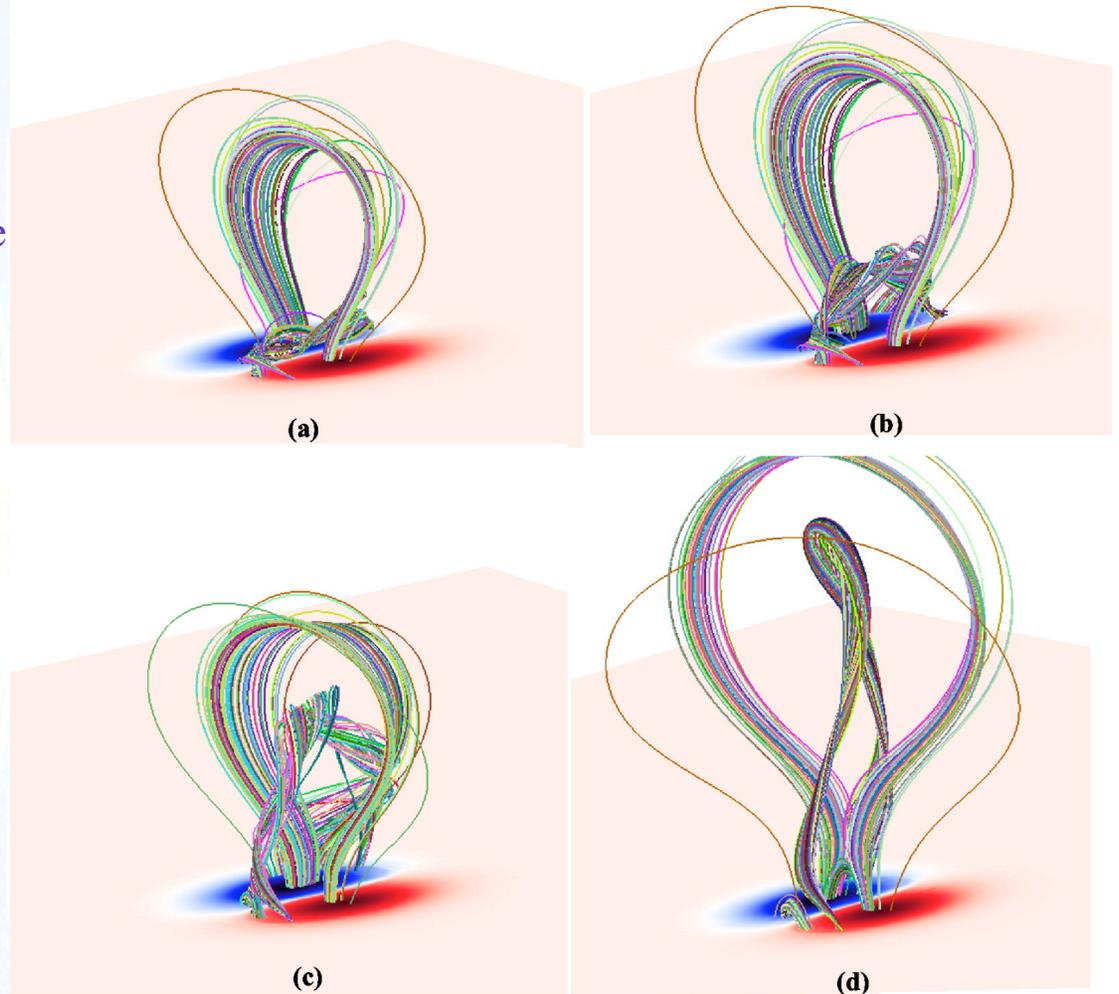

- Moore et al. 2001, ApJ 552, 833

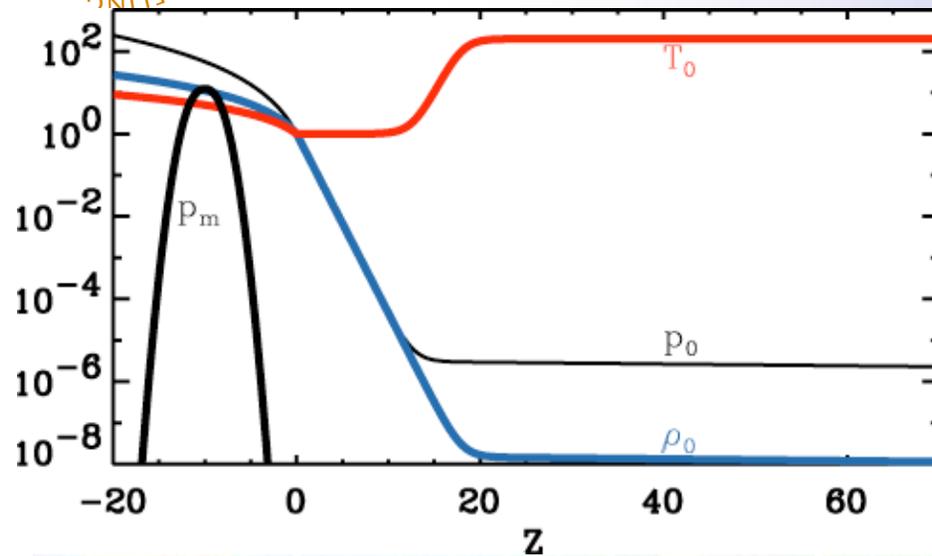

## CME Models Including Photospheric Shear

### Magnetic Arcade Models

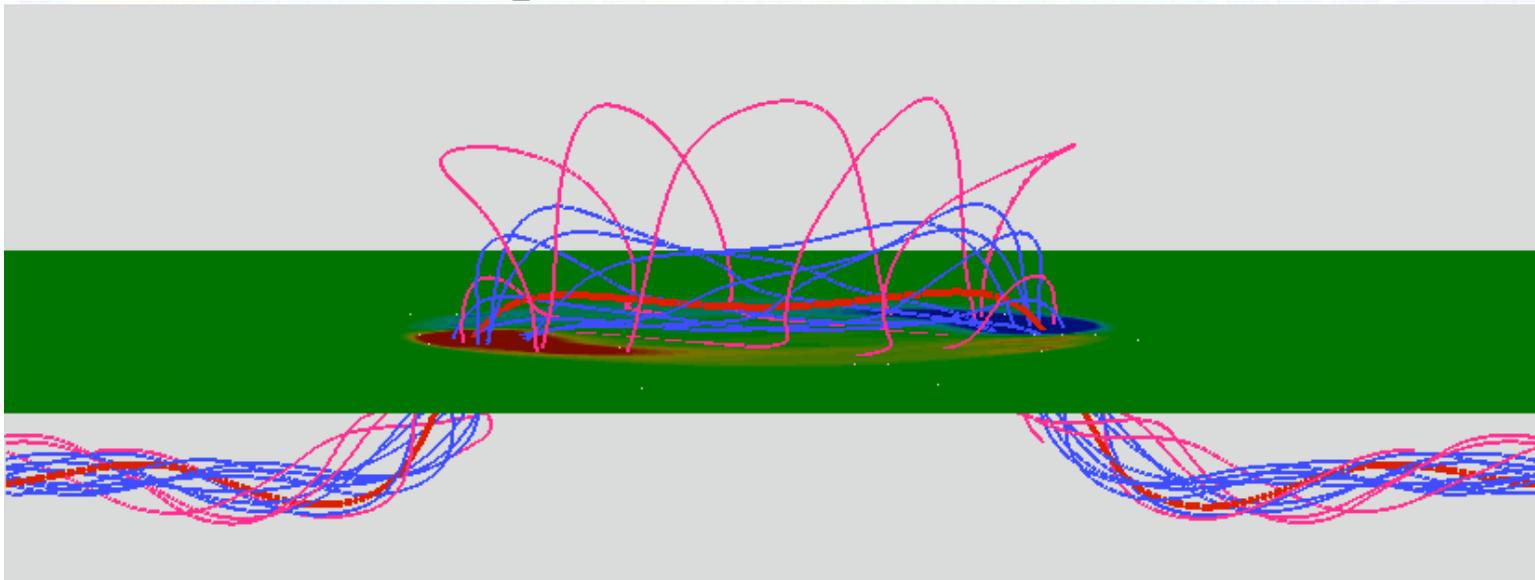

- *Imposed* shearing of foot points with magnetic reconnect at the base of the arcade (Mikic 1988, Mikic and Linker 1994, Choe and Lee 1996, Amari 2003)
- Break-out model: *Imposed* shearing motions and reconnection above the arcade in a quadruple system

## Emergence of a 3D flux rope

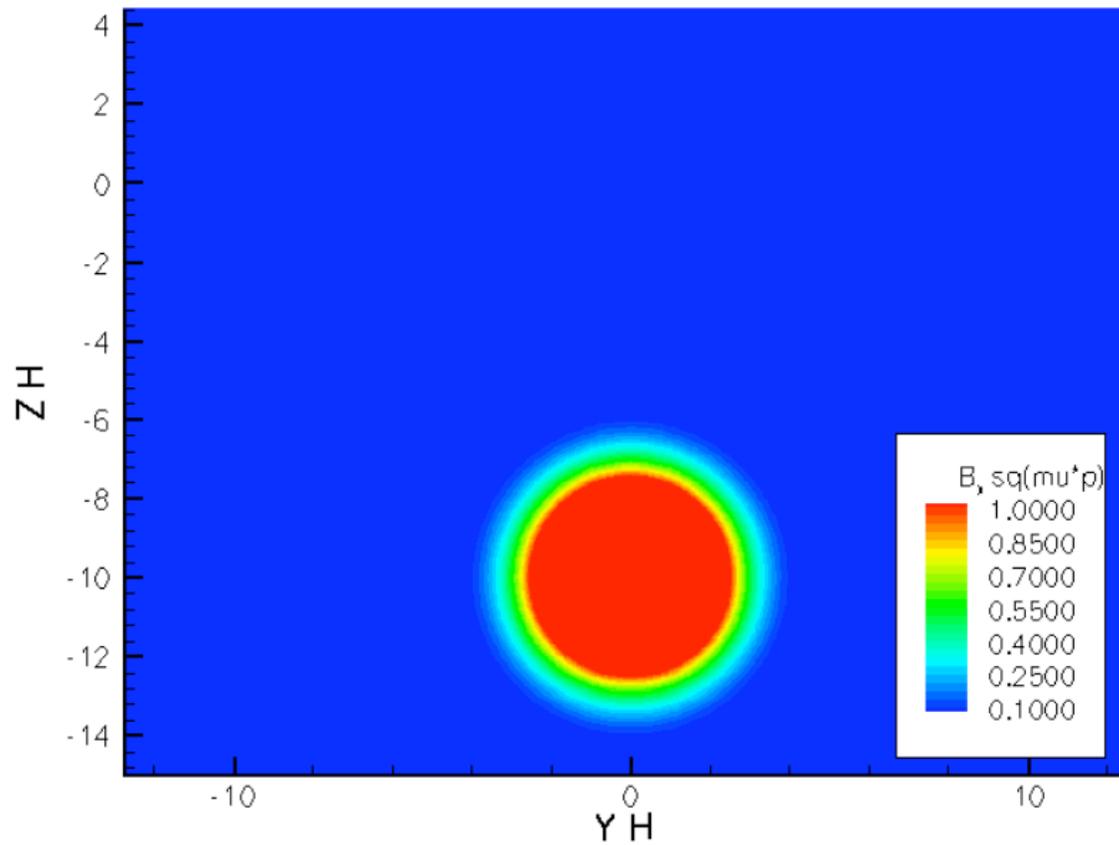

- Manchester et al. 2004, ApJ 610, 588  
Initial state from Fan 2001, ApJ 554  
L111

# Flux Rope Emerging From the Convection Zone into the Corona

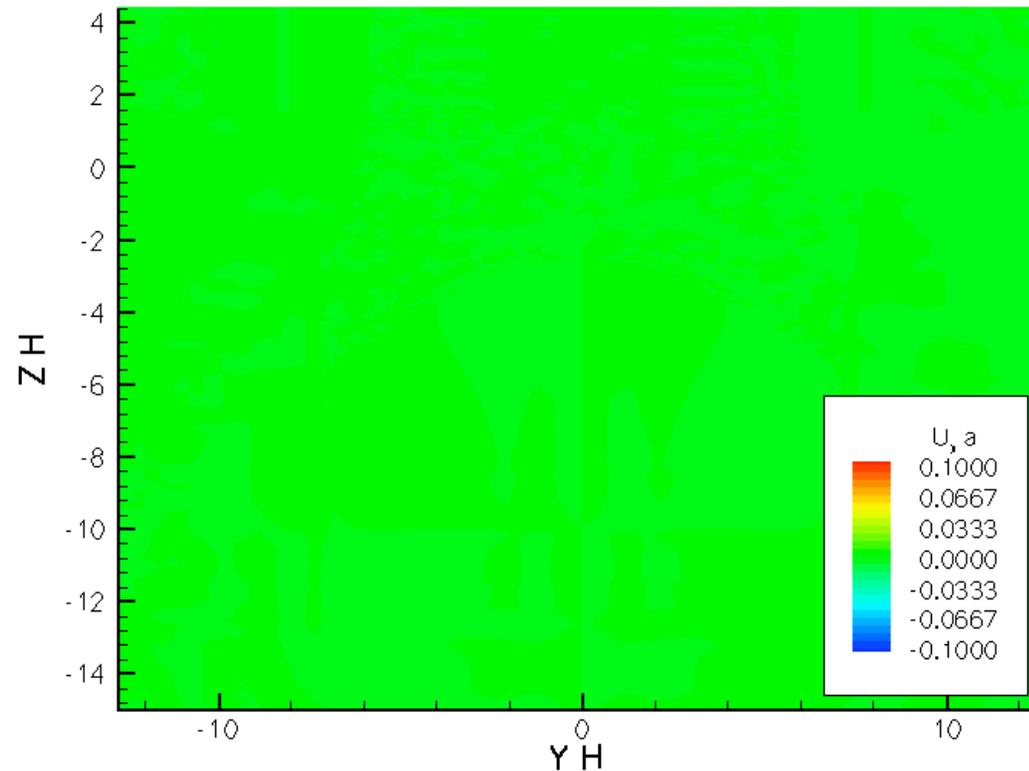

- Initial state from Fan (2001)
- Buoyant section of the flux rope reduced by a factor of two

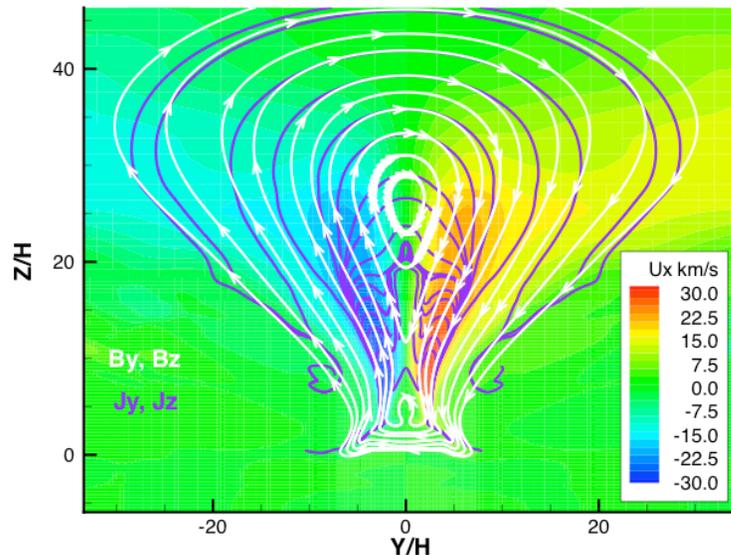

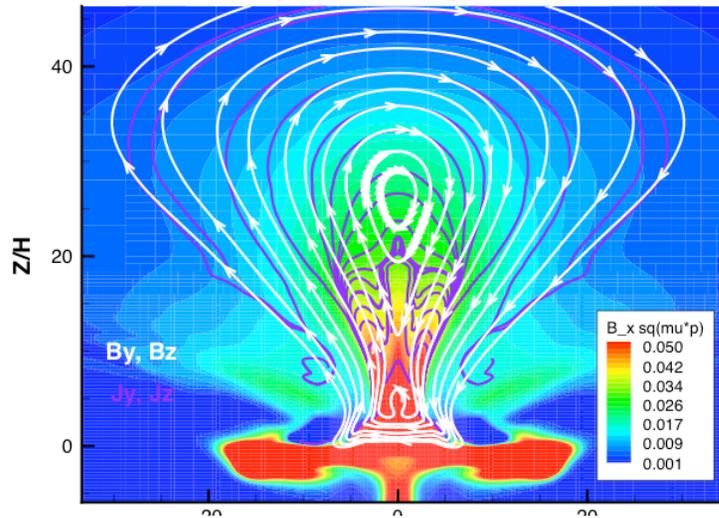

# Spontaneous Shearing Motions

- Opposite sides of the flux rope move in opposite directions as the flux rope expands.
- Motions are driven by the Lorentz force!

# Tension component of the Lorentz Force Drives the Shearing!!

$$F_x = \nabla B_x \cdot (B_y, B_z)$$

$$\frac{\partial B_x}{\partial t} + \nabla_{yz} \cdot (B_x(V_y, V_z)) =$$

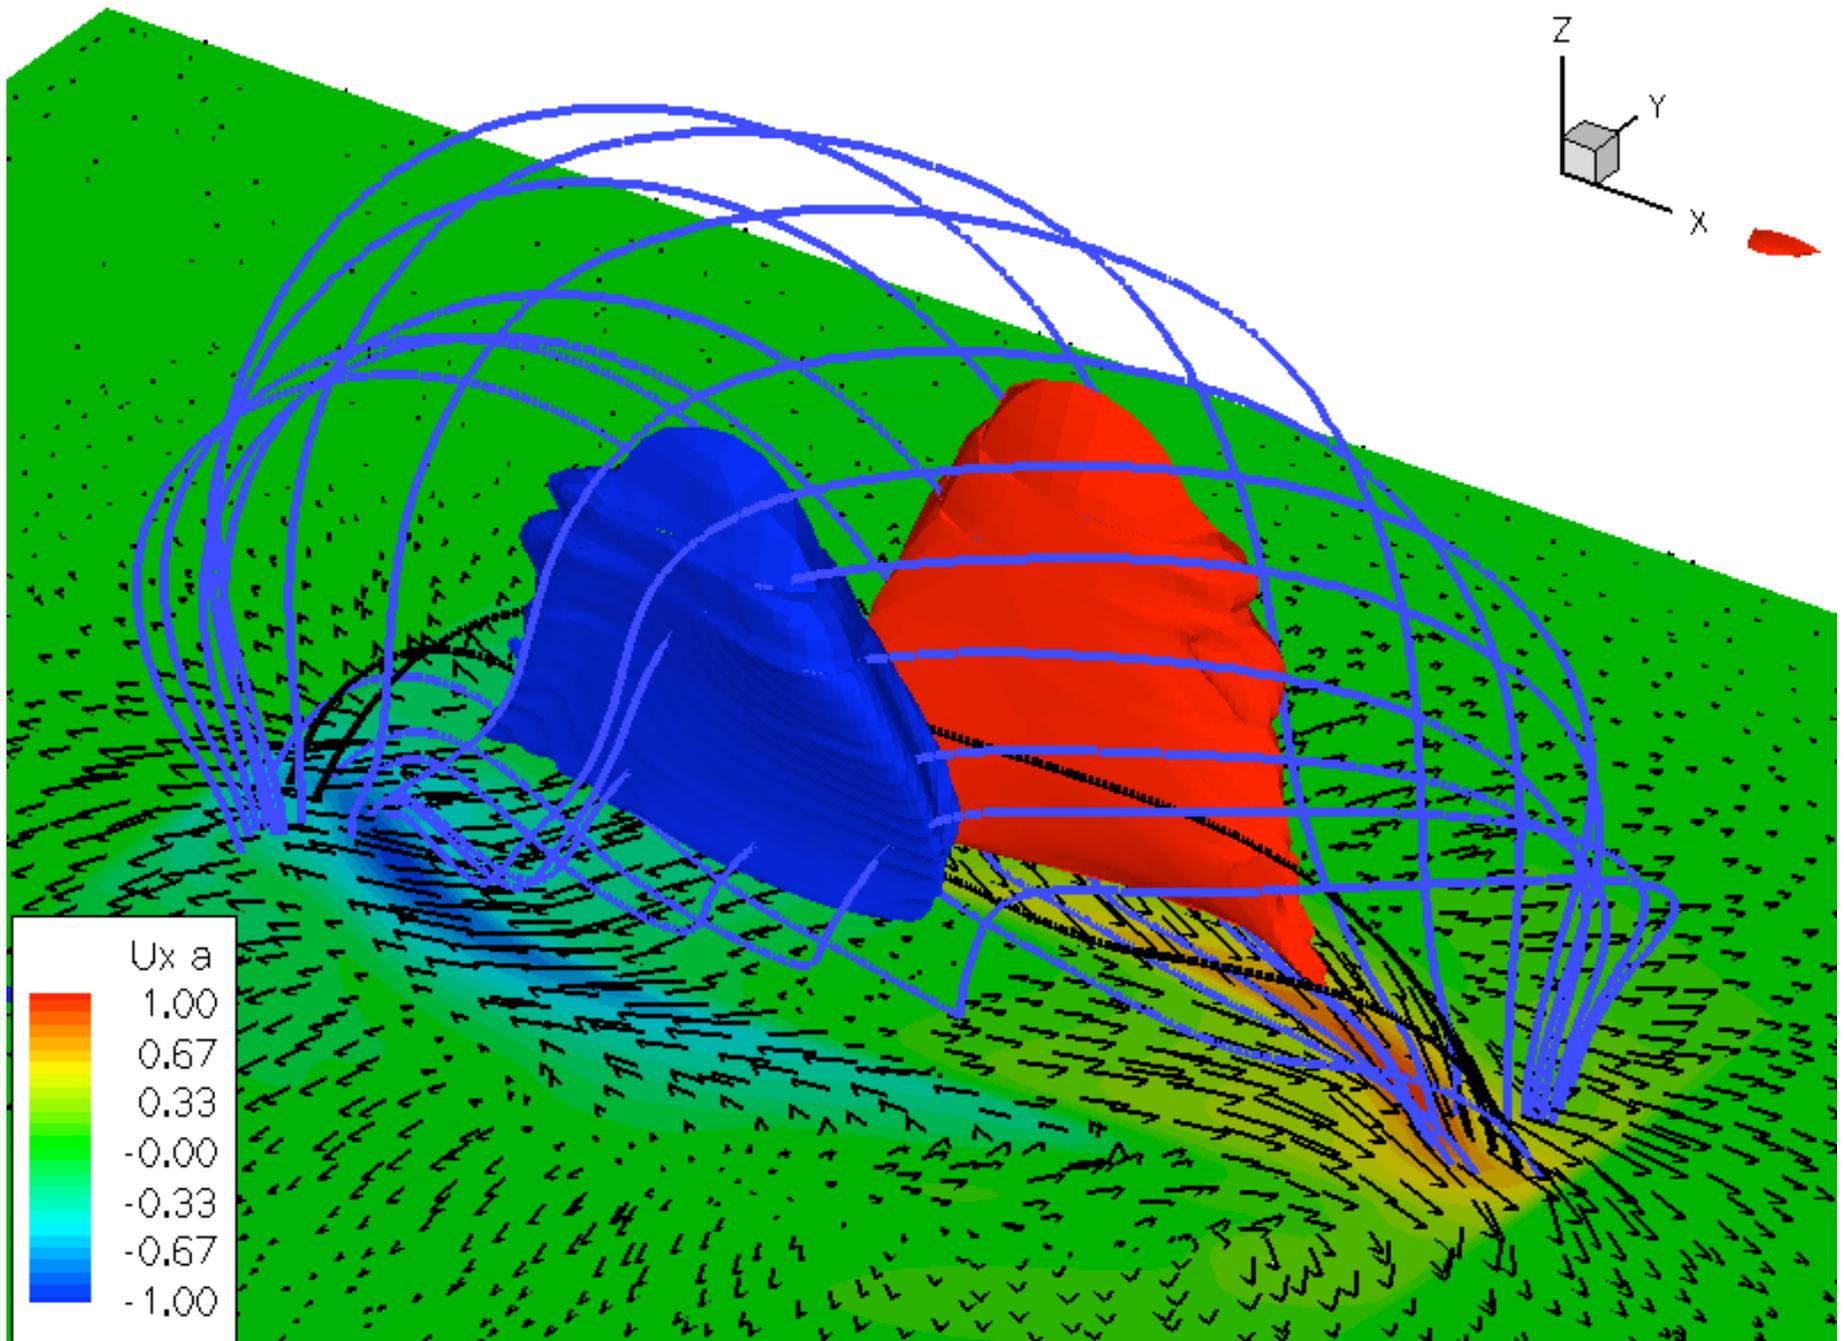

advection in the yz plane

$$\frac{\partial}{\partial y}(V_x B_y) + \frac{\partial}{\partial z}(V_x B_z)$$

shearing displacement

- Shearing motions transport  $B_x$  flux into the expanding portion of the flux rope and tends to return  $B_x$  to constant values along field lines to restore force balance
- Loss of equilibrium occurs from a shearing catastrophe when the field traverses many pressure scale heights and  $B_x$  can not be equilibrated

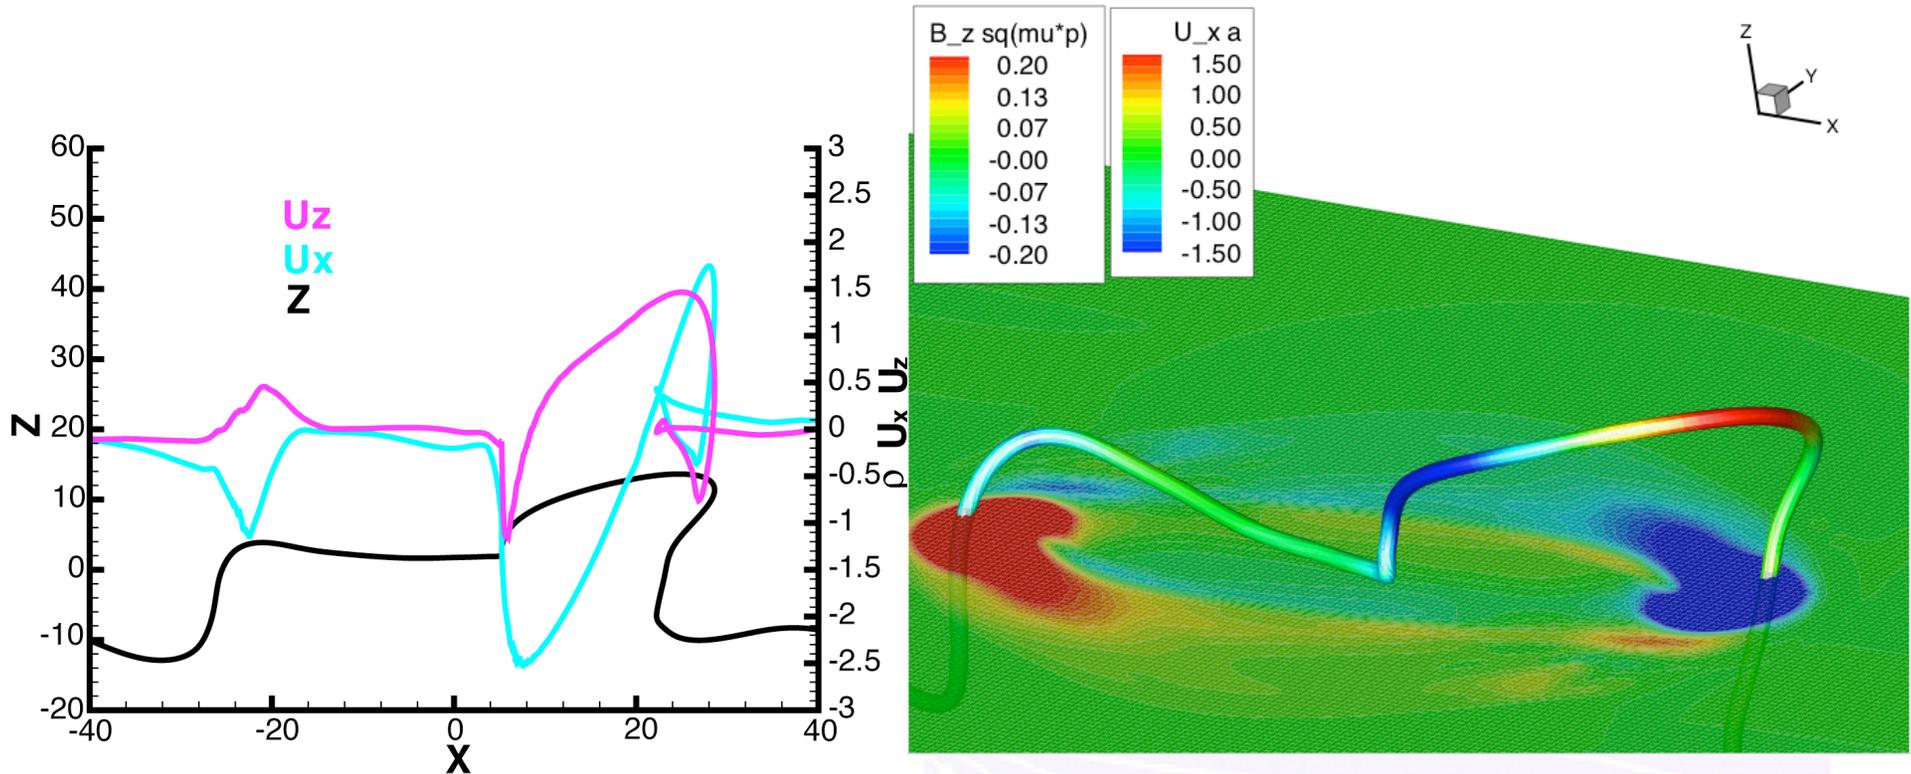

deling

<http://csem.engin.umich.edu>

# Eruption of a Magnetic Field Line

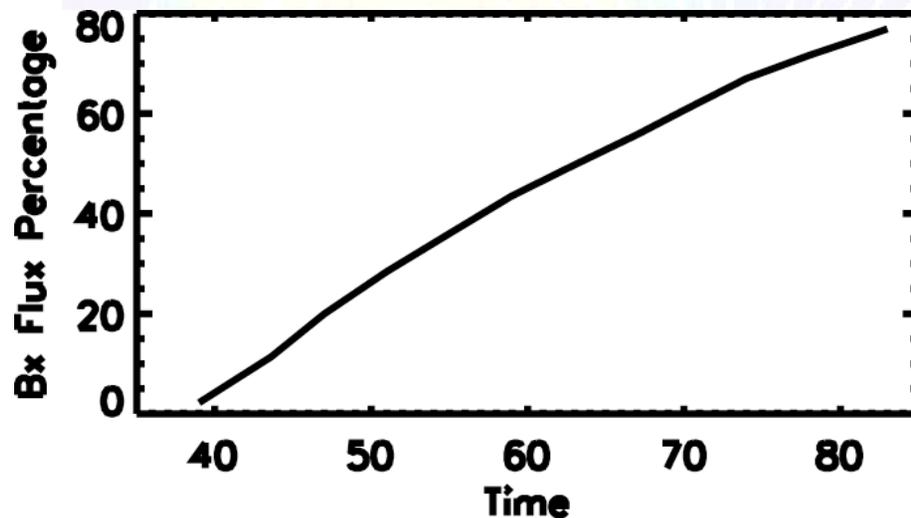

The field line locally erupts where the field line is being sheared and propagates as a shear Alfvén wave along the field line.

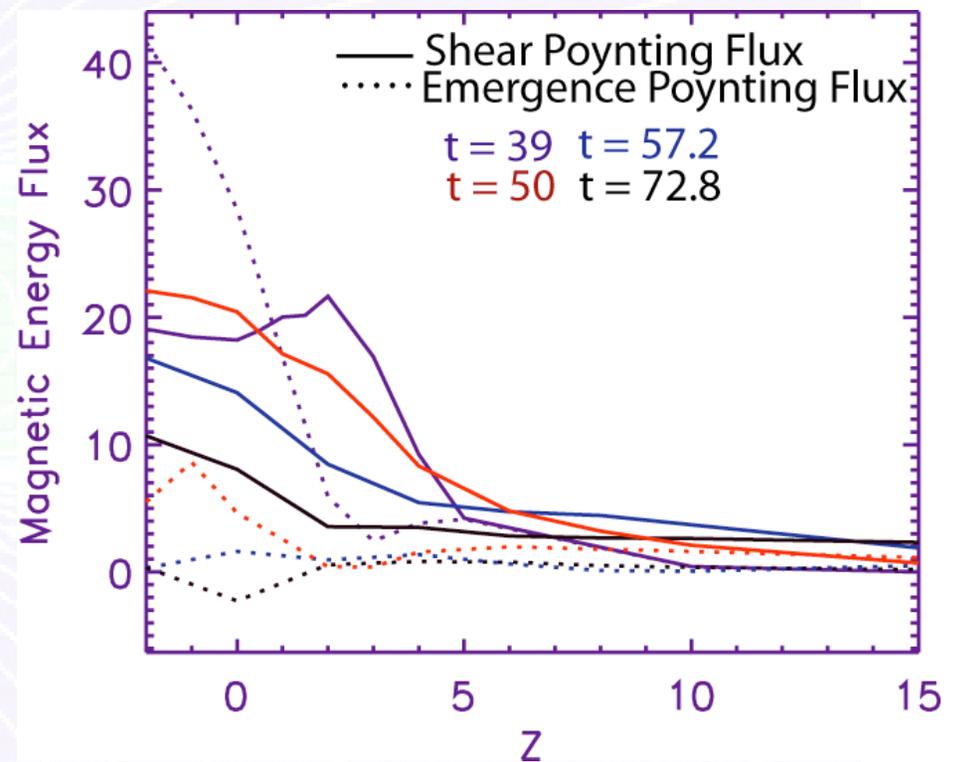

# Shearing motions are a transport process!

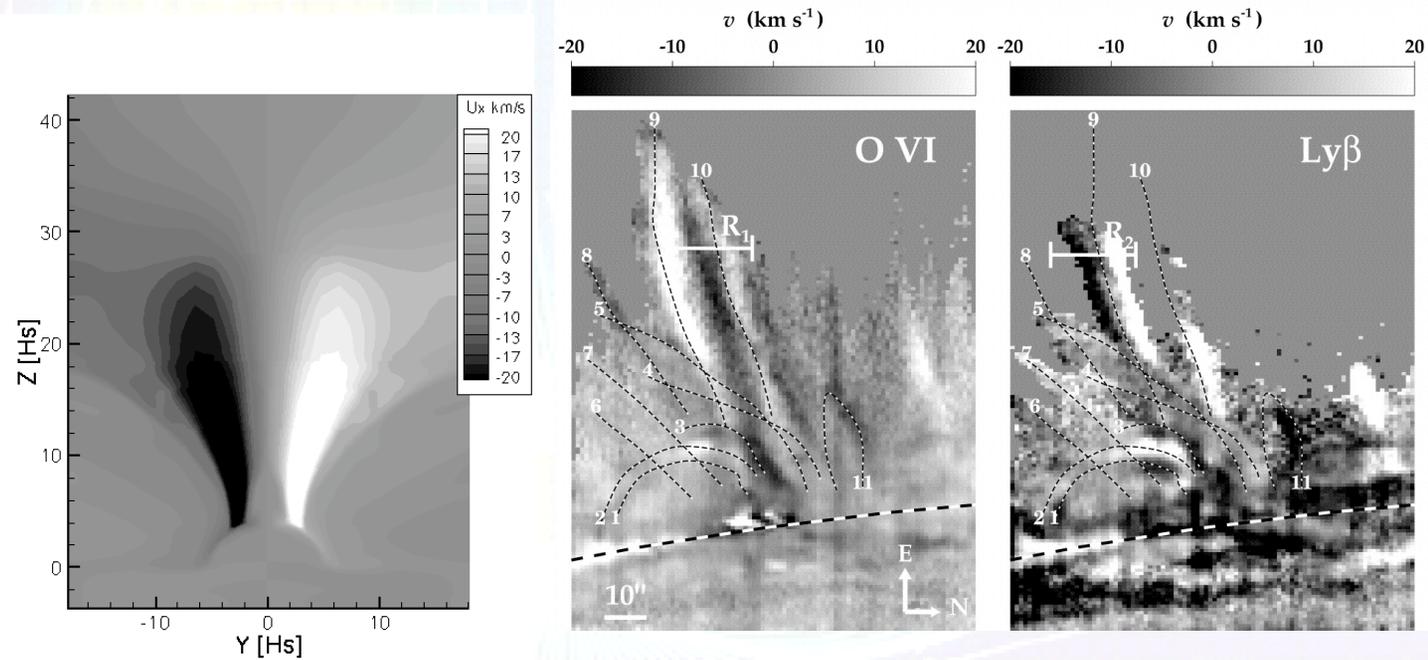

Axial Flux Transport

Energy Transport (Poynting Flux)

## Comparison of Shear Velocity

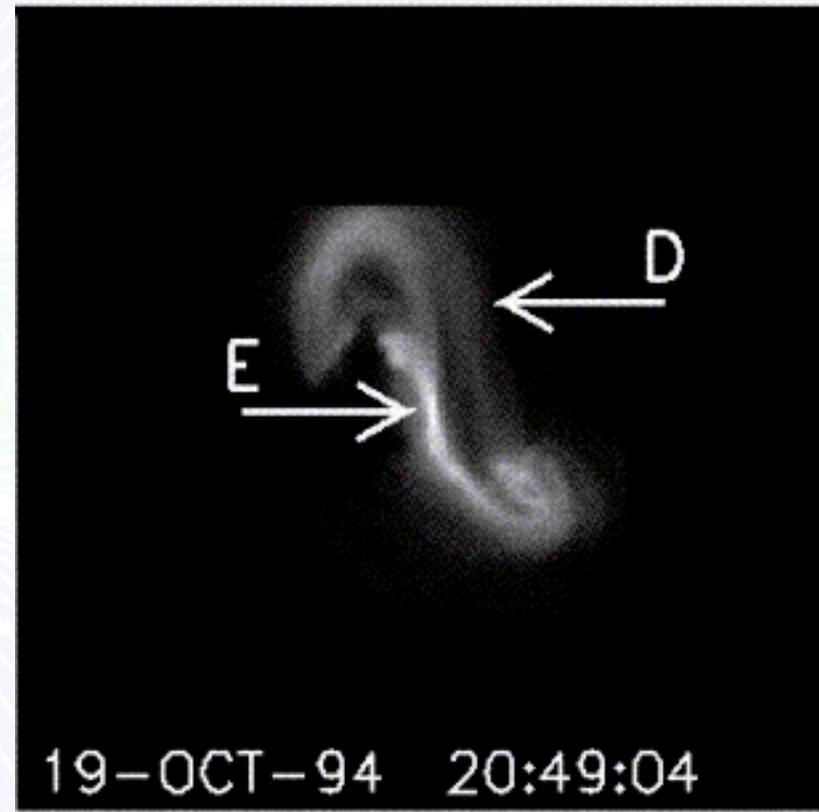

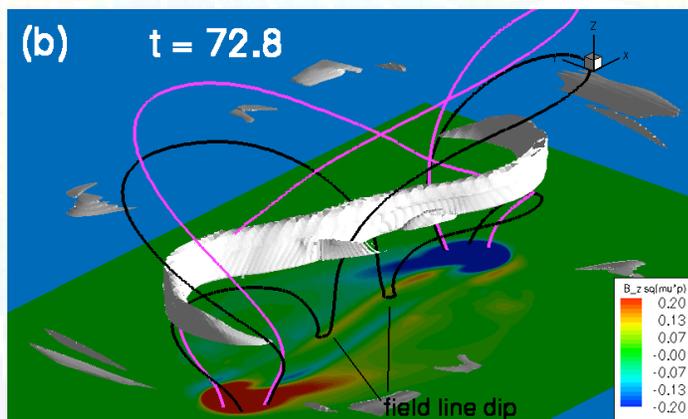

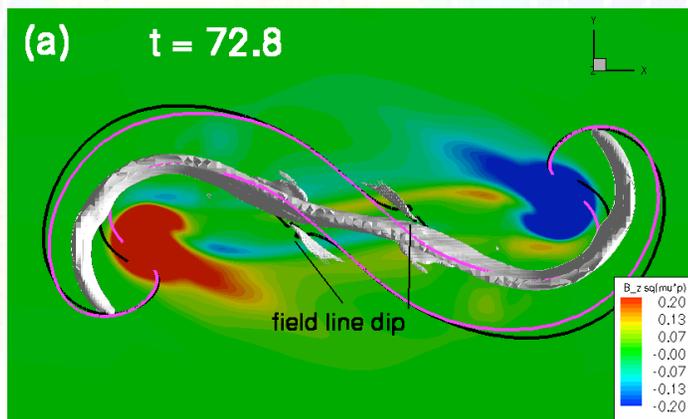

The image on the left, the shear velocity at the mid-plane of the simulation is shown. On the right, Doppler velocity maps of active regions at the limb made with SUMER Chae et al. 2000, ApJ 533, 535,

## Formation of a Sigmoid Current Sheet

To the left, an iso-surface of current density and field lines are shown over the photosphere colored to show  $B_z$ . To the right, observations of X-ray sigmoids by Moore et al. (2001)

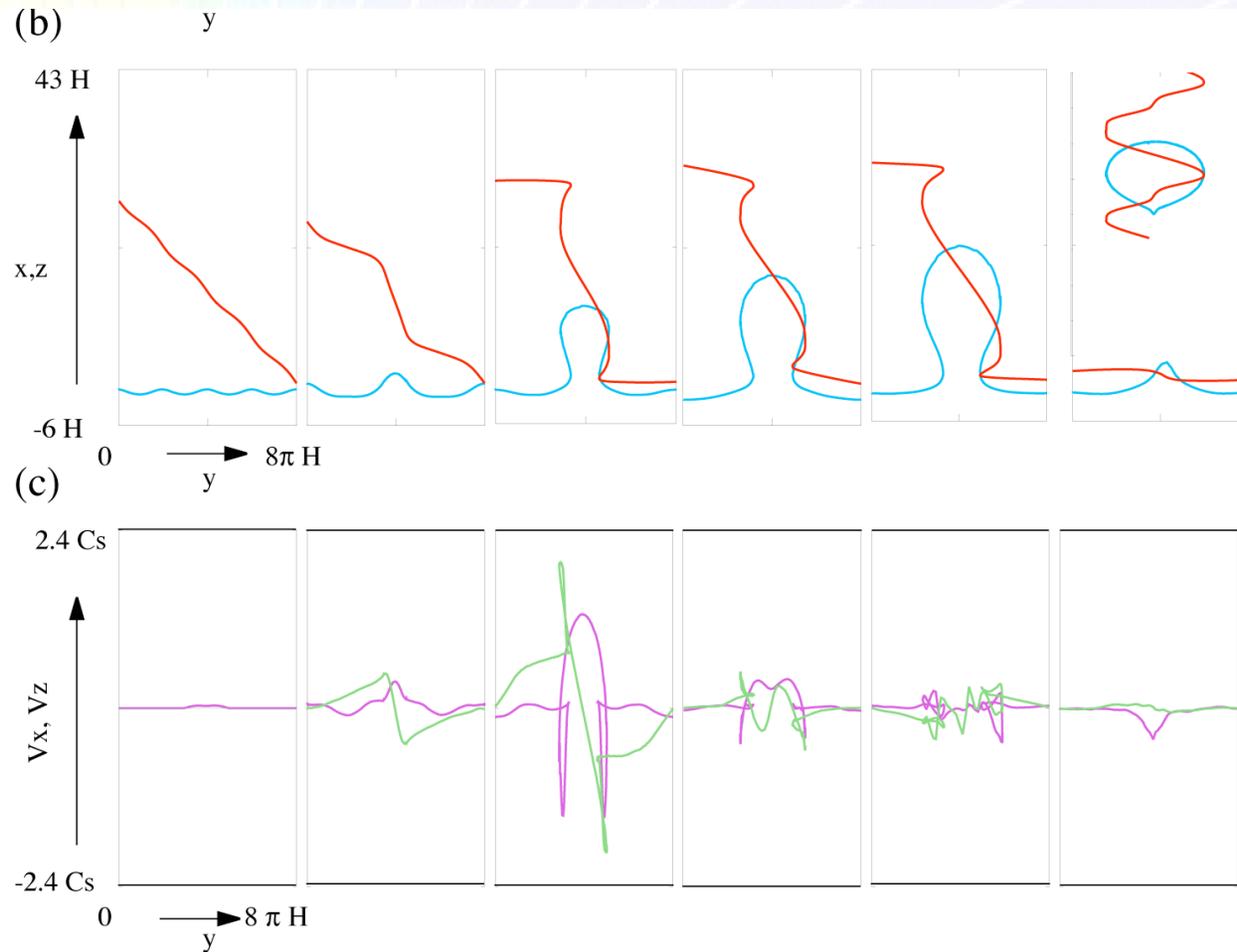

## Conclusions

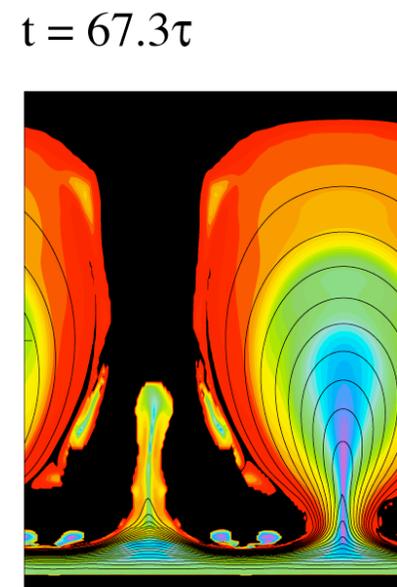

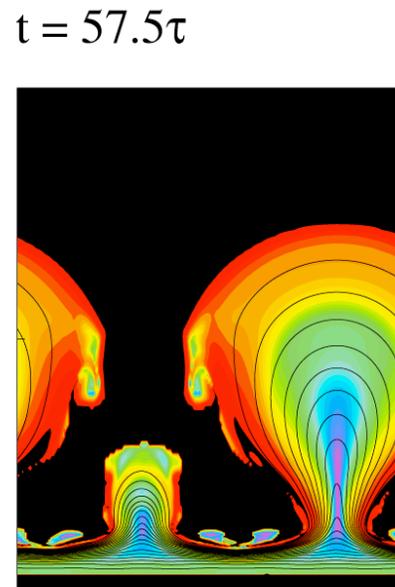

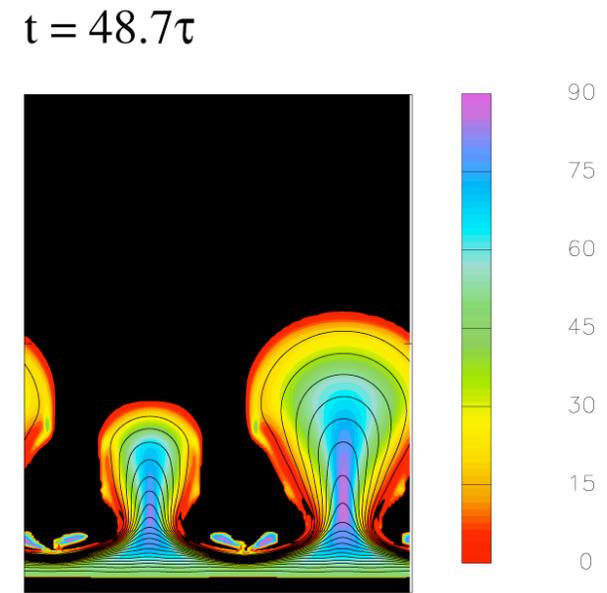

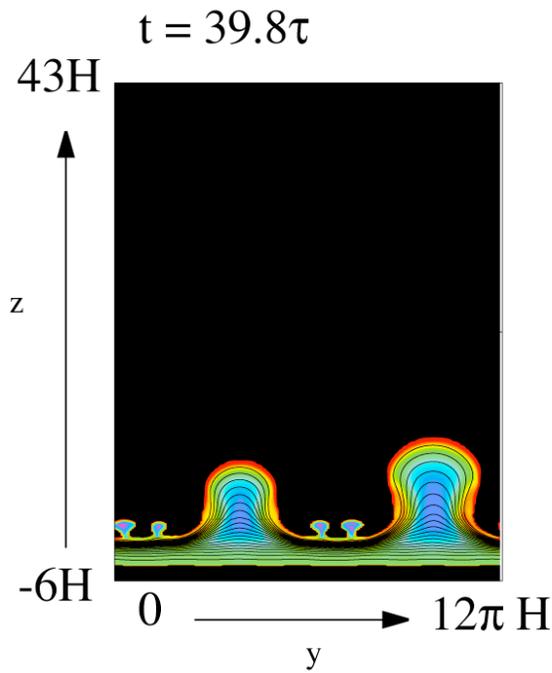

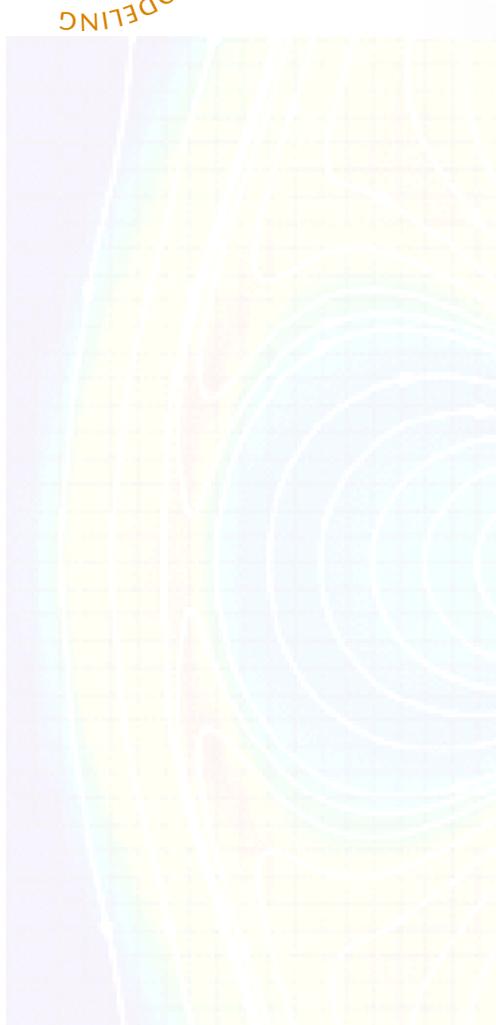

- Shearing motions are an inevitable consequence of the Lorentz force that arises as the magnetic field expands in a highly stratified atmosphere which naturally explains:
- Coincidence of the magnetic neutral line and the velocity neutral line
- Impulsive nature of shearing in newly emerged flux
- Magnitude of the shear velocity in the photosphere, chromosphere and corona that occur at a characteristic fraction of the local Alfvén speed.
- The large scale pattern of shear in active regions which increases with proximity to the neutral line
- Shearing motions transport axial flux into expanding portion of the flux rope and strongly couple the low  $\beta$  corona to the high  $\beta$  photosphere and below
- The eruption of the flux rope and arcade occur with shearing motions and reconnection explains CMEs and flares
- Multiple (homologous) eruptions from arcades that occur as a slow build up and expansion followed by eruption
- Formation of a sigmoid shaped current-sheet
- The force-free paradigm is incorrect. With a more complete model of magnetic field traversing a large range of plasma beta, the ad hoc application of shearing motions can be put to rest

## Fundamental Assumptions

- The Sun possesses a gravitational field that results in large pressure stratification of the atmosphere
- Non-force-free magnetic structures pass that through the photosphere into the corona to form active regions are larger than pressure scale height at the photosphere (140 km)
- Magnetic field possess a horizontal axial component in addition to an azimuthal component
- The Lorentz force can be represented by  $(\text{curl } B) \times B$
- Applies to arcades and flux ropes
